

## **Evaluation of Melina Lopez-Racine's Project Contributions**

Melina was a great help in keeping project ideas manageable during brainstorming sessions or at times during which we would suddenly come up with ideas. It helps that she was the one who looked most into what sensors we should/could make use of. After settling on the sensor and main idea (at each time) she was in charge of most of the Part One documentation. Afterwards, once we had finally settled on a main idea to pursue she came up with The overall form of the object and put it together. Some of the initial idea sketches were made by her as well. Overall she put a great amount of work into this project, going out of her way to get the main object materials as well as the TCS230/TCS3200 colour sensor. She also put in additional time in building the object at the woodshop, and painting the necessary components for the sensor to detect. Taking into account what would be possible with the sensors and what we had discussed. During initial research into what we would be building, she also provided some references on the sensors we may use, as well as what could be done with them.
